## Lemma 1: Uniqueness of liquid interface pressure

*Consider the isothermal case with  $273.15 \text{ K} \leq T_0 \leq 623.15 \text{ K}$ . Then for given interface pressure  $p_V^*$  of the vapor phase with  $0 \leq p_V^* \leq \tilde{p}$  the kinetic relation and the corresponding equations of state define the liquid pressure  $p_L^*$ , uniquely. Furthermore, by these relations the mass flux  $z$  is uniquely defined.*

## Lemma 2: Monotonicity of liquid interface pressure

*For given temperature  $273.15 \text{ K} \leq T_0 \leq 623.15 \text{ K}$  the implicitly defined function  $p_L^*(p_V^*)$  is strictly increasing.*

## Lemma 3: Monotonicity of $z[[1/\rho]]$

*For given temperature  $273.15 \text{ K} \leq T_0 \leq 623.15 \text{ K}$  the expression  $z[[\frac{1}{\rho}]]$  is strictly increasing in  $p_V^*$ , where  $z$  depends on the implicitly defined function  $p_L^*(p_V^*)$ .*

M. Hantke

Outline

Introduction

Model description

Phase boundaries

Classical waves

Riemann problem  
for two phase  
flows, Case 1

Riemann problem  
for two phase  
flows, Case 2

Nucleation and  
cavitation

**THEOREM 1:** Let  $f$  be given as  
 $f(p, \mathbf{W}_V, \mathbf{W}_L) = f_V(p, \mathbf{W}_V) + f_L(p, \mathbf{W}_L) + \Delta v$ , where the functions  $f_V$   
and  $f_L$  are given by

$$f_V(p, \mathbf{W}_V) = \begin{cases} \frac{p-p_V}{\sqrt{\rho_V p}} & \text{if } p > p_V \text{ (shock)} \\ -a_V \ln p_V + a_V \ln p & \text{if } p \leq p_V \text{ (rarefaction)} \end{cases}$$
$$f_L(p, \mathbf{W}_L) = \begin{cases} \frac{p-p_L}{\sqrt{K_0 \rho_L \left(\frac{p-p_0}{K_0} + 1\right)}} & \text{if } p > p_L \text{ (sh.)} \\ -a_L \ln \frac{\rho_L}{\rho_0} + a_L \ln \left(\frac{p-p_0}{K_0} + 1\right) & \text{if } p \leq p_L \text{ (rf.).} \end{cases}$$

If the function  $f(p, \mathbf{W}_V, \mathbf{W}_L)$  has a root  $p^*$  with  $0 < p^* \leq \tilde{p}$ , this root is unique and is the unique solution for pressure  $p_V^*$  of the above Riemann problem. The velocity  $v_V^*$  can be calculated as follows

$$v_V^* = \frac{1}{2}(v_V + v_L) + \frac{1}{2}(f_L(p^*, \mathbf{W}_L) - f_V(p^*, \mathbf{W}_V)) .$$

## Lemma 6

*For  $p_L \geq p_0$ , there exists no solution of wave pattern type c).  
For  $p_L < p_0$ , the condition  $p_V^*(p_L) \geq p_0 \exp(-\sqrt{2\pi})$  is sufficient, that there is no solution of type c).*

# Solution of isothermal Euler equations, Case 2

**THEOREM 2:** Let  $f_z$  be given as

$$f_z(p, \mathbf{W}_V, \mathbf{W}_L) = f_V(p, \mathbf{W}_V) + f_L(p_L^*(p), \mathbf{W}_L) + z \left[ \frac{1}{\rho} \right] + \Delta v \text{ with}$$

$$f_V(p, \mathbf{W}_V) = \begin{cases} \frac{p-p_V}{\sqrt{\rho_V p}} & \text{if } p > p_V \text{ (shock)} \\ -a_V \ln p_V + a_V \ln p & \text{if } p \leq p_V \text{ (rarefaction)} \end{cases}$$

$$f_L(p, \mathbf{W}_L) = \begin{cases} \frac{p_L^*(p) - p_L}{\sqrt{K_0 \rho_L \left( \frac{p_L^*(p) - p_0}{K_0} + 1 \right)}} & \text{if } p_L^*(p) > p_L \text{ (sh.)} \\ -a_L \ln \frac{\rho_L}{\rho_0} + a_L \ln \left( \frac{p_L^*(p) - p_0}{K_0} + 1 \right) & \text{if } p_L^*(p) \leq p_L \text{ (rf.)} \end{cases}$$

If the function  $f_z$  has a root  $p^*$  with  $0 < p^* \leq \tilde{p}$ , this root is unique. If further

$$p^* > p_V \quad \text{we must have} \quad z > -a_V \sqrt{\rho_V \rho_V^*}. \quad (1)$$

In this case the root  $p^*$  is the unique solution for the pressure  $p_V^*$  for a  $b$ )-type solution of the above Riemann problem with phase transition and the complete solution is uniquely determined.

**THEOREM 6:** Consider the above Riemann problem and assume the nucleation criterion is satisfied. Let  $f_{Vz}$  be given as

$$f_{Vz}(p, \mathbf{W}_{V-}, \mathbf{W}_{V+}) = f_{V-}(p, \mathbf{W}_{V-}) + f_{V+}(p, \mathbf{W}_{V+}) + 2z \left[ \frac{1}{\rho} \right] + \Delta v = 0 .$$

Here  $z$  is given by the kinetic relation and  $\left[ \frac{1}{\rho} \right] = \frac{1}{\rho_{L*}} - \frac{1}{\rho_{V*}}$ . The function  $p_L^*(p)$  is implicitly defined.

If the function  $f_{Vz}$  has a root with  $p_0 < p \leq \tilde{p}$ , then this root is the only one. Furthermore, this root is the unique solution for pressure  $p_{V*} = p_{V**}$  of the Riemann problem for the vapor pressure in the star regions. The liquid velocity  $v_{L*}$  can be calculated by

$$v_{L*} = \frac{1}{2}(v_{V-} + v_{V+}) + \frac{1}{2}(f_{V+}(p_*) - f_{V-}(p_*)) .$$
